How does TD-Vault work?

TD-Vault is an integrated part of the Industry 4.0 ecosystem with smart factory connections, data transparency as well as information visualization for proactive and optimized operations.

When your T-DRILL machine is linked to TD-Vault, you will get a real-time overview of production details, piece counters, performance, overall equipment effectiveness… Customizable, to best fit your needs.

T-DRILL's intuitive online system shows current status of production, and when it's time for service. Production orders with premade machine settings can be sent directly to the T-DRILL machine with a push of a button – minimizing the set-up time and increasing the productivity level.

If required, that data can also be accessed by a T-DRILL service engineer for diagnostics. T-DRILL's team can help to optimize production when granted access to machine details. With this information maintenance can be scheduled not to interrupt production.
